# Distribution diagrams

These diagrams have been computed at two Li concentrations ( $1 \text{ mM} = 1 \times 10^{-3} \text{ mol L}^{-1}$  and  $1 \mu\text{M} = 1 \times 10^{-6} \text{ mol L}^{-1}$ ) with the ‘best’ equilibrium constant above (in green). Calculations assume  $T = 298 \text{ K}$  for the limiting case of zero ionic strength (*i.e.*, even neglecting plotted ions).
